

BOOK MATCHED

This is the standard method.

The various veneer strips are joined together in mirror image pairs. This means that each strip is the reflection of the previous one. This technique lets you see perfectly how the log was handled.

SLIP MATCHED

This technique is often chosen if the veneer needs to be stained. Staining means no colour difference can be seen between the different veneer strips on a panel.

REVERSE SLIP MATCHED

This has all the advantages of a slip matched sheet of veneer.

In addition, the boards do not all have to be the same way up. This makes it unbelievably easy for the customer to work with a veneered panel.

MIXMATCHED

Our manufacturer has developed its own patented machine for the mix matched or planked technique, in which the veneers are jointed together randomly to give the final sheet the appearance of solid wood with-out disadvantages such as warping as the humidity varies

Our manufacturer can process veneers of various thickness in this way (0.6mm, 1mm, 1.5mm and 2mm) the thicker veneers are used when additional structuring needs to be applied.
